Abstract

Major changes have been proposed in the Romanian baccalaureate during the last years in order to overcome the massive baccalaureate failures. There is little research for investigating the emotion-regulation mechanisms involved in college performance, and no research available on Romanian population in terms of the predictors of baccalaureate performance or further academic performance. This study aimed at investigating the psychological factors contributing to the baccalaureate failure of the Romanian students. 60 participants were included in this study, half of them registering failure to the baccalaureate exam. We found that baccalaureate failure is correlated with both mother’s and father’s low education levels. When irrational cognitions of the students and mother’s education or father’s education are accounted together, they explain a third of the baccalaureate failure. Students failing baccalaureate reported using more self-blaming and other blaming among the dysfunctional emotion-regulation strategies. Furthermore, lower scores in terms of attention control, more specifically for attention shifting, were reported by students who failed the baccalaureate. When considered together with mother’s education level, student’s optimism no longer predicted baccalaureate success. Implications of our results are discussed emphasizing the need to develop interventions at the appropriate level.

Keywords

Baccalaureate failure/success, student emotion-regulation, irrational cognitions, optimism, parent’s education
