Abstract: In this paper we describe our examination about the experts' decision making both in their expert domain and outside of their domain. The decision situations we created are based on the prisoner's dilemma game, thus the situations are analogous. We hypothesized that experts' decisions are influenced by the fact that the decision situation is inside or outside of their domain. The object of the second research is to study the cooperation in the case of beginners in a domain and the changing of cooperation in the function of feed-back. Our results proved that the experts' decision depends on decision style determined by the domain.

Keywords: decision making, prisoner's dilemma, domain specificity, analogy, feed-back, expert.
